Description

I'm regularly frustrated that while the wiki supports code highlighting for various languages using <pr><code class="cpp">
</code></pre>, it doesn't support "shell"/"bash" cf. CodeHighlightedText

This redmine forum post: http://www.redmine.org/boards/3/topics/29926 seems to have 3 possible solutions. Two involve adding configuration to the coderay highlighter, while one replaces coderay with a more general Rouge highlighter.

Could one of these be pursued?
