Description

A FileFormatVersion is associated with a given type of file (e.g. Root file, raw data file). Version numbering for each can be incremented independently, and the FileFormatVersion of a file of type X has nothing to do with the FileFormatVersion of a file of type Y.

Thus the functions art::getFileFormatVersion and art::getFileFormatEra should be renamed to indicate that they return the data appropriate for our Root format files. We do not seem to need similar functions for any other file type, at this time.
