Description			
<p>The processor board in the PXIMPS front-end doesn't reboot reliably. At this time we're not sure whether it's an issue with it connecting to the backplane (other cards have been added and removed, which could cause slight flexing in the backplane board) or if there's an actual problem with the processor card. It seems to be in a stable state at the moment, so this issue is just to remind us that there may be a lurking problem.</p>			

History

The board has been much better during the past 6 months. It's been screwed into place, which may have improved the contact with the backplane. If we start having problems again, we'll open a new issue.
