| Description | | | |
| camcon.fnal.gov is a Unix machine with 8 serial ports. It was used to connect to and log all the console interaction for the CAMAC front-ends. Over time, other front-ends were added. We need to see if all these ports are still being used. | | | |

History

Tim finished a lot of work on this system. Tim, is this issue completed or do we need to do more?

#2 - 12/15/2016 01:37 PM - Timothy Zingelman

All I did was update the hardware and OS... I did not mess with the serial port connections, labels & port configs (i.e. speed.) That still needs to be done.

Recall I mentioned there are multiple FE's attached via a switchbox, and that they have differing baud rates... that should be fixed for sure.
