Description

It is customary to specify the configuration of a service under the name of the service itself. For example:

```
services: {
  SpaceChargeService: {
    service_provider: SpaceChargeServiceMicroBooNE
    # ...
  }
}
```

This is mandatory for concrete services (e.g. Geometry), but *art* surprisingly does the right thing with service interfaces.
Anyway, the name of the space charge *art* service is SpaceChargeService, not SpaceCharge.
The configuration in services_microboone_basic.fcl and other files are using the latter, and that should be fixed.
