Target version:	
Description The names of our standard root files produced in the main processing chain are a bit messy. In some cases (reco stage), all root files are called reco_hist.root. SAM uses the filename as a database key and so must be unique. 'reco_hist.root' is obviously a problem. While declaring MCP 0.5 to SAM, I've used the following naming standard: hists_ARTROOTFILENAME.root Unless anyone has any objections, I would like to deploy this naming scheme to: gen, g4, detsim, reco Anatree is the exception to this rule and should conform to the ARTROOT naming scheme
