Description

We want to investigate (and possibly correct) some behavior of the jobsub client with the --use-cvmfs-dropbox option. To be more specific, we want to see what happens in the following two cases:

1. Use --use-cvmfs-dropbox and multiple -f options with tardir:// or dropbox://. Will this create multiple symlinks in $CONDOR_DIR_INPUT as we'd expect?
2. Use --use-cvmfs-dropbox and a mix of -f and --tar_file_name [tardir|dropbox] options. Will this also create multiple symlinks?
