Description			
<p>My RFQ Beamline Overview display stopped working yesterday morning, at about the time the JAVA server work was done. At least that is when I noticed it. Now when I try to launch the display I get a page that says, "Synoptic Display Failed, Display is Broken". I didn't do any major changes to the display yesterday morning, and hadn't done any display work since the day before when the program crashed due to running out of memory. Anyway, I tried launching the display from the builder and it seems to work fine. I tried re-saving and re-committing it and it still doesn't work. The other displays I have done work so it seems to be an issue with this one. Here is the address for the web display.</p> <p>http://www-bd.fnal.gov/synoptic/display/Work_in_progress/Karns/RFQ_test</p>
