Description

In the current scheme, after successful job submission, the jobsub server returns the output of the condor job submission which has the condor job id. However, this condor jobid itself is not enough to uniquely identify the job when there are multiple schedds. To allow for that, the jobsub server should parse the condor's jobid and create an unique jobsub job id based on the following scheme or something similar.

${COLLECTOR_HOST}--${SCHEDD_NAME}--${CONDOR JOBID}
