Verified that the rpm creates .rpmnew and .rpmsave files according to the rules. I found this documentation at http://www-uxsup.csx.cam.ac.uk/~jw35/docs/rpm_config.html

In summary: if a file is not marked as a config file, or if a file has not been altered since installation, then it will be silently replaced by the version from an update RPM. If a config file has been edited on disk, but is not actually different from one RPM to another then the edited version will be silently left in place. It is only when a config file has been edited and is different from one RPM to the next that what happens depends on the (noreplace) option. If absent, the new file will be installed, and the the old edited version will be renamed with a .rpmsave suffix. If present, the edited version will be left in place, and the new version will be installed with a .rpmnew suffix. I don't know what happens if RPM needs to create an .rpmsave or .rpmnew file and one already exists - at least in some cases it seems that the new file isn't written under these circumstances.
