Target version:	nightly		
Description			
Hello folks,			
So I am trying to go back to a nightly release I created last week and continue developing and I get an error. I only get this error on uboonegpvm04....this works on other uboone machines Here is the exact set of commands I run			
<pre>source /grid/fermiapp/uboone/software/setup_uboone.sh setup uboonecode nightly -q debug:e4 setup ubtools setup jobsub_tools cd /uboone/app/users/jasaadi/NewRelease_git_mrb_debug_v2/ source localProducts_larsoft_nightly_debug_e4/setup cd build/ source mrb s source mrb slp</pre>			
Here is the error I get:			
<pre>MRB_SOURCE=/uboone/app/users/jasaadi/NewRelease_git_mrb_debug_v2/srcs MRB_BUILDDIR=/uboone/app/users/jasaadi/NewRelease_git_mrb_debug_v2/build MRB_PROJECT=larsoft MRB_PROJECT_VERSION=nightly MRB_QUALS=debug:e4 MRB_INSTALL=/uboone/app/users/jasaadi/NewRelease_git_mrb_debug_v2/localProducts_larsoft_nightly_debug_e4 PRODUCTS=/uboone/app/users/jasaadi/NewRelease_git_mrb_debug_v2/localProducts_larsoft_nightly_debug_e4:/grid/fermiapp/uboone/software/products:/grid/fermiapp/products/uboone:/grid/fermiapp/products/larsoft:/grid/fermiapp/products/common/db The working build directory is /uboone/app/users/jasaadi/NewRelease_git_mrb_debug_v2/build The source code directory is /uboone/app/users/jasaadi/NewRelease_git_mrb_debug_v2/srcs ----- check this block for errors ----- ----- local product directory is /uboone/app/users/jasaadi/NewRelease_git_mrb_debug_v2/localProducts_larsoft_nightly_debug_e4 ----- check this block for errors ----- /uboone/app/users/jasaadi/NewRelease_git_mrb_debug_v2/localProducts_larsoft_nightly_debug_e4/larreco/v1_00_02/slf6.x86_64.e 4.debug directory not found: SETUP ABORTED -----</pre>			
I am working on uboonegpvm04.			
When I switch to uboonegpvm05, the setup works fine.			
Thought I should let someone know...

- Subject changed from Broken release? to Error setting up local products on uboonegpvm04 (was: Broken release?)
- Status changed from New to Feedback
- Target version changed from develop/HEAD to nightly

I would suggest you to skip the source mrb setupLocalProducts (slp) the first time.

There are some local products in your local area, but none of them is yet compiled for Scientific Linux 6 (slf6), which is the type of machine uboonegpvm04 (and only that one) is.
Skip that and compile everything (mrb install) and the next time all the products in your local area will have also a SLF6 version and everything will be fine.

If you just want easier life, do not mix working areas of SLF5 and SLF6 (i.e. new working area for uboonegpvm04).

By the way, the release is **not** broken (at least, not for this reason).

- *Status changed from Feedback to Resolved*

In general, there is no reason to source mrb slp before building. This is used to setup local products after you have built and installed them.
