Description			
<p>I'm having trouble getting set up with nusoft. I am following the instructions on the wiki to the letter and I think the problems I'm experiencing are coming from dependency issues...maybe.</p> <p>From a clean shell, I made a new working directory and checked out a read only version of nutools. I sourced the setup script at /nusoft/app/externals/setup, and then I get a failure trying to run this command from the build directory:</p> <pre><lar1ndgpvm01.fnal.gov> source ../nutools/ups/setup_for_development -d The working build directory is /lar1nd/app/users/cadams/nutools/build The source code directory is /lar1nd/app/users/cadams/nutools/nutools ----- check this block for errors ----- ERROR: Product 'cetbuildtools' (with qualifiers ""), has no v4_01_03 version (or may not exist) -bash: /bin/set_dev_products: No such file or directory -bash: .: filename argument required .: usage: . filename [arguments] ERROR: setup of required products has failed</pre> <p>It looks to me that it's not finding cetbuildtools with the appropriate version; I looked for v4_01_03 and couldn't find it. ups list -ak+cetbuildtools tells me that the latest version is v4_00_00.</p> <p>I must be missing a setup step here. Can anyone help me identify what I've missed to setup nutools?</p> <p>Thanks! Corey</p>
