<b>Description</b>			
<p>Figure out a robust distribution scheme that will allow new versions of the code to be distributed (a) to all known instances of the project and (b) to all registered users of the project.</p> <p>The idea is that soon there will be instances of the project in places that are not controlled directly by the author(s). There will need to be a mechanism for either alerting these places/people of this new distribution and/or pushing it to them. Moreover, it is likely that not every "push" will be worthy of this action, so there needs to be a way to deal with this, too.</p>			

### History
