Description			
It would be nice if each camera could have an editable device list to be captured and stored in the meta data along with the picture to preserve pertinent beamline parameters (beam energy, intensity, pulse number, etc). It would also be nice if we could use a subset of these to aid in automatic generation of the One-Shot acquisition image.

I'm thinking a "Device List" button on the "Camera Configuration" panel would open a window with a list of ACNET devices. But when should the devices be sampled?

Could you expand on this idea? I'm not sure what you mean.
